SITE 1101: Principles of Information Systems

Individual Project: Personal Website

The loud claim fades; the quiet deed remains ~ Tao Te Ching

You will develop your understanding of programming by **developing a personal portfolio website.** This project aims to provide you skills in coding with GenAI, gain experience with **git version control** and **Github** platform, and host your static (HTML/CSS & JavaScript-based) personal portfolio website on **Github Pages**.

Set up git and Github by watching this tutorial. Understand the purpose of each. It will drastically help you both in your current project and in future courses.

Start developing your website. You should have already installed *VSCode* or *Cursor* (see Syllabus) which comes with an AI agent.[1] Your website should have the **following pages**:

- **Home Page** with a profile photo and a text summarizing who you are, etc.
- **About Page** introducing your background, qualifications, conducted activities (not necessarily only in this course), etc.
- **Projects Page** introducing your projects (each should have title, description, photos/screenshots, etc.). It must include Project 1, Project 2 (Hour of Code), and Project 3 (Robotics). You can add another project that you wish to add.
- If you wish, you can add any other page (e.g. resume, blog, etc).
- **Text** in your website should **not** be generic AI-written sentences.

Additionally, **make sure to have**:

- **Navigation bar** (menu) and **Footer**.
- **Icon** leading to the website's Github repository. It is okay to add additional links/icons.[2]
- **Modularized** and **clean code/repository** structure, and `README.md` file in your Github repository explaining your project.

Make commits. Make sure to commit your progress with two main commands consistently: `git add` and `git commit` you will be using often when making important additions to the website. Your Github repository should show these commits (you will use `git push`). AI agent can do it for you as well.

Export your AI chat. Cursor AI chat (similarly VSCode) has an option to export chat as a markdown file (.md). **The file should show your conversation with AI during the whole development progress. Chat summary or meaningless conversation will not be accepted.** The submitted chat should consist of your requests and the answers of the AI agent to your requests. It is fine to submit an AI chat beyond 50-100 pages. **Make sure to consistently save your chat to not lose your conversation history by accident** (AI agents refresh chat every once in a while).[3]

---

[1] Optionally, *LiveServer* extension will help you during the website development.
[2] It is suggested to not publish your email on the web to reduce the chance for receiving spams.
[3] Note that there is a limit in the number of requests you can send to an AI agent. If you hit the limit, you can switch to a different AI agent and then merge your conversation into a single file.

Host your website on Github Pages. Follow the instructions to activate your website for the web. It should be a quick process once you understand how git/Github works. Your website will be served at https://[YOUR_GITHUB_USERNAME].github.io and should be accessible to anyone on the web.[4]

10% bonus will be provided for adding an **interactive gamified resume or about page** (see this example) . You must use your creativity and not follow the exact same style as in the example. The grading of this criterion will be subjective.

You will submit three items:

1. Link to your website at Github Pages.
2. Link to the Github repository of the website hosted under your username.
3. Full AI chat markdown file.

The **grading checklist** (yes/no) corresponding to the requirements above is as follows (all the requirements noted previously should also be followed):

- ☐ Repository link not submitted or is private or doesn't have website code (-50 pts)
- ☐ AI chat markdown file not submitted, is incomplete, or is unrelated (-25 pts)
- ☐ Github Pages website link not submitted or link doesn't work/exist (-25 pts)
- ☐ Nice interactive gamified resume or about page (+10 pts)

- ☐ Home and About pages about student exists (20 pts)
- ☐ Projects page with at least Project 1 (title+description+image) exists (20 pts)
- ☐ Multiple commits showing development progress by the student exists (20 pts)
- ☐ There are no major design issues (missing images, unreadable text, etc) (20 pts)
- ☐ Code is clean and modular (code/files/folders nicely organized) (20 pts)

Presenting someone else's work as your own will be accepted as the **violation** of Honor Code. When submitting, make sure to **consider upload time** and other logistical issues. **Important.** Deadline policy is noted in the syllabus. **Good luck!**

[4] If you already have your website hosted in that URL, you can host new project at https://[YOUR_GITHUB_USERNAME].github.io/SITE-1101, similar to the website of this course.
